

# GEOVIA MINESCHED™ RELEASE NOTES 2023

## ENHANCEMENTS

### Setup Schedule

#### Use the Automatic Routes tab to define automatic haulage

You can use the new Automatic Routes tab to define automatic haulage and select the source, destination, destination point, truck type, and if you want the route to be automatic. You can access the Automatic Routes tab from the Setup Schedule > Material Flow > Haulage > Haulage routes tab.

#### Display the material movement rules on the Automatic Routes tab

You can use the new Truck allocation to material movement path data grid to display the material movement rules in which the source and destinations are defined. In this data grid, you can select the destination roads, trucks, and enable the use of the automatic routes. You can access the Automatic Routes tab from the Setup Schedule > Material Flow > Haulage > Haulage routes tab.

#### Create nodes at the haul line connection points

On the Setup Schedule > Haulage tab, while importing haul lines or roads, nodes are created at the connection points where two or more roads are joining:

- Nodes are created only at end points, if two roads are intersecting and contains multiple points in common but the points are not end points, nodes are not created at the points.
- For all roads (like, haul or bench road), end-to-end connections are checked within the specified tolerance.
- For bench roads only, intermediate connections are checked with other haul roads because benches can join the haul road in between.

#### The Adjust the haulage search radius functionality is displayed in the Roads tab

The Adjust the haulage search radius functionality that was earlier located on Haulage routes tab, is now shifted to the Roads data grid. The functionality related to getting the haulage results from manually defined haulage routes is the same. Now, this search radius is used to create nodes to check the connection tolerance between the connection points (end points of haul lines or roads).

#### Define automatic routes for material movement rules

When you define a haulage route as automatic in the Truck allocation to material movement path data grid, the haulage route is Automatic for material movement rules with the same source and destination locations. You can access the Truck allocation to material movement path data grid on the: Setup Schedule > Material Flow > Haulage > Haulage routes > Automatic Routes tab.

#### MineSched searches for the best start point on available roads for automatic routes

For automatic haulage routes, MineSched now searches the first starting point and roads according to the source block of the hauled materials for the best possible route. The first starting point of the road is searched according to the elevation of the source block of the hauled material. If the best elevation exists at multiple points, the best elevation within the shortest distance is selected. The search also considers any pit points if defined on any of the haul roads. Only one pit point can exist on each haul road.

#### Priority rules for shortest path for automatic haulage workflow

MineSched now finds the shortest path from the source block position to the destination road or block using the haulage nodes which are created at connection points of haul lines. The search for the shortest path also considers the priorities of the haul lines. At each node, MineSched checks the connected haul lines and selects the haul lines with the highest priority. A node-to-node search continues from the first starting point that is calculated until the destination is reached. Out of all the resulting options, MineSched calculates the distances and uses the shortest path.

#### Updated name of Bench collections tab

On the Haulage tab, the Bench collection tab is now renamed as the Collections tab that contains the following sub-tabs:

- Road Collections (to define Road Types and Road Rolling Resistance values)
- Bench Collections

#### Create Road types and enter Road rolling resistance values

You can create multiple Road types and enter Road rolling resistance values for each road type, that can be applied for each year. You can assign Road types to each haul road or a bench road.

#### Apply date and seasonal changes

You can apply date and seasonal changes in roadway grade and velocity calculations related to road types and road rolling resistance factor values on the new Road Collections tab. You can now define different resistance values for the schedule or seasonal changes for a year that is applied for the future as well. You can access the Road Collections tab using the Setup Schedule > Material Flow > Haulage > Collections tab.

#### Import production data from CSV and ODBC data sources

You can import data from different databases (CSV and ODBC files) on the Manage Data Sources form. You can select the relevant production tab to map the database table fields to the corresponding Production tab fields.

### **Import data for the production resources features**

You can import data from CSV and ODBC files on the Manage Data Sources form for the production resources features. On the Manage Data Sources form, you can perform the following functions on the data sources:

- Insert
- Delete
- Edit Mapping
- Refresh

### **Import data for the ancillary resources features**

You can import data from CSV and ODBC files on the Manage Data Sources form for the features of the ancillary resources.

Create nodes at the connection point for automatic haulage workflow

On the Setup Schedule > Material Flow > Haulage tab, you can now view nodes created at

connection points of haul lines in the 3D Canvas. To verify that the connected haul lines to a node, hover over the node in the canvas, and details of the node appear. You can choose to display nodes from the Display menu functions in the 3D Canvas.

### **Starting point, global speed limit, and wildcard usage in Automatic haulage workflow**

The Automatic haulage workflow now supports the use of the global speed limit and wild card usage while defining material movement rules. Also, the functionality for selecting the best starting point has been improved.

### **Import ancillary data from CSV and ODBC files**

You can import data from different databases (including CSV and ODBC files) for ancillary activityrelated tab fields. You can select the relevant ancillary tab to match database table fields to corresponding MineSched fields.

### **View the Calendar tab in Data integration**

When you use the Data Sources menu, you can import data from the CSV or ODBC files to view the Calendar tab on the Edit Mapping form.

### **Import data for the production capacities features**

You can import data from CSV and ODBC files on the Manage Data Sources form for the production capacities features.

### **Import production rates data from CSV and ODBC data sources**

You can import data from different databases (CSV and ODBC files) on the Manage Data Sources form. You can select the relevant production rates tab to map the database table fields to the corresponding Production Rates tab fields.

### **Use the road types and rolling resistance values to calculate truck velocities**

When you use rimpull tables to define the truck velocities, you can select road types and rolling resistance values to calculate the velocities of a truck on the haulage route. Truck velocities vary according to different road types and rolling resistance values. You can access the truck velocities on the tab: Setup Schedule > Material Flow > Haulage > Haulage routes.

### **Import ancillary capacities data from CSV and ODBC data sources**

You can import data from different databases (CSV and ODBC files) on the Manage Data Sources form. You can select the relevant ancillary capacities tab to map the database table fields to the corresponding Ancillary Capacities tab fields.

### **Import ancillary rates data from CSV and ODBC data sources**

You can import data from different databases (CSV and ODBC files) on the Manage Data Sources form. You can select the relevant ancillary rates tab to map the database table fields to the corresponding Ancillary Rates tab fields.

### **Select Continuous to make the equipment work continuously for Working calendars**

You can import data from different databases (CSV and ODBC files) on the Manage Data Sources form. On the Edit Mapping form, when you select Continuous in the Calculation Type column on the Calendar tab, you can map the database table fields to the corresponding Calendar tab fields for Working and Holiday calendars. You can define the dates in between which the equipment works continuously for Working calendars.

### **Select Durational to make the equipment work for a specific time period for Working calendars**

You can import data from different databases (CSV and ODBC files) on the Manage Data Sources form. On the Edit Mapping form, selecting Durational in the Calculation Type column for the Calendar tab maps the database table fields to the corresponding Calendar tab fields for Working and Holiday calendars. You can define the time period the equipment works, even for Working calendars.

### **Undo redo support for road types and rolling resistance values**

MineSched now supports undo and redo for road types and rolling resistance values in the data grid view.

### **Undo redo support for Automatic Routes tab**

MineSched now supports undo and redo on the Automatic Routes tab. The material movement rules are also updated according to the undo redo changes.

### **Override Rimpull/Retard workflow for Bench Collections**

You can select the new check box Override rimpull/retard velocities to assign default velocities to bench roads. The rimpull/retard velocities for bench roads that are used in defined routes or automatic routes are replaced with specified d-field velocities or bench collection velocities. You can access the check box on the Collections tab on the Setup Schedule > Material Flow > Haulage tab.

### **Automatic haulage route support for stockpile and process**

You can enter the x,y, and z coordinates in the new Stockpile Position and Process Position fields when you assign stockpile and plants as source locations for the automatic haulage route functionality.

### **Assign global speed limit for automatic haulage routes**

The Assign Global Speed Limit icon has been added to the Automatic routes tab. You can view any changes in the existing Assign Global Speed Limit functionality on the Defined routes tab, on the Automatic routes tab, and vice-versa.

## **Publish Results**

### **The Publish Results tab supports the new automatic haulage workflow**

The Publish Results tab now supports the new automatic haulage workflow. All the haulage reports are generated as usual but can also include the data from automatic haulage routes. The Haulage route name is displayed as Automatic for automatic haulage routes.

## ISSUES FIXED

### Miscellaneous

#### The relative expression check issue for inactive ancillary activities is resolved

When the ancillary activity is inactive and you enter an Expression for the Relative quantity and then run a schedule, MineSched now creates the schedule successfully.

#### A confirmation message related to scheduling is now translated

MineSched now translates and displays the confirmation message related to recreating scheduling models in Russian and Chinese.

#### Eyeshot update

MineSched now supports the latest Eyeshot 2022 version.

#### DevExpress upgraded to version 21.2.7

MineSched now uses the DevExpress version 21.2.7.

## Create Schedule

### The location validation issue is now resolved

The location validation occurs only when there are any changes in the location geometry and properties, or when you add new locations.

### Data is retained for the Column option

On the Customise Report form, when you select the Column option in the Period order list and

then change the data in the report, the data is now retained.

## Setup Development

### Evaluate headings in scenarios with multiple models

Now, you can correctly evaluate all headings in scenarios with multiple models.

### Insert a row in the spreadsheet view

When you now use the spreadsheet view, you can insert a row by right-clicking the row header and then clicking Insert. This functionality is available only for persistent spreadsheet views.

## Our 3DEXPERIENCE® platform powers our brand applications, serving 11 industries, and provides a rich portfolio of industry solution experiences.

Dassault Systèmes, the 3DEXPERIENCE® Company, is a catalyst for human progress. We provide business and people with collaborative virtual environments to imagine sustainable innovations. By creating 'virtual experience twins' of the real world with our 3DEXPERIENCE platform and applications, our customers push the boundaries of innovation, learning and production. \*Dassault Systèmes' 20,000 employees are bringing value to more than 270,000 customers of all sizes, in all industries, in more than 140 countries.
